NSW BIODIVERSITY CREDIT OPPORTUNITY MAP

Metadata record (ANZLIC profile)

This record follows the core elements of the **ANZLIC Metadata Profile v1.1** (AS/NZS ISO 19115). It describes the main output layer, `subregion_ranking.csv`, which joins to `ibra_nsw.gpkg`, and the supporting tables.

Identification

Element	Value
Title	NSW Biodiversity Credit Opportunity Map: areas for further investigation
Alternative title	Remnant vegetation of six under-supplied ecosystem credit types by IBRA subregion
Abstract	Remaining mapped extent, protected extent and an opportunity score for six Plant Community Types (PCTs) that have zero credits available on the NSW Biodiversity Offsets Scheme (BOS) credit supply register but continue to be retired. Values are summarised by IBRA v7.1 subregion and ranked to show regions worth investigating for new Biodiversity Stewardship Agreements.
Purpose	Portfolio analysis to support targeting of new biodiversity credit supply. Not for site-scale decisions.
Keywords	biodiversity offsets; biodiversity credits; plant community type; remnant vegetation; IBRA; stewardship; NSW
Topic category (ISO 19115)	biota; environment; planningCadastre
Status	Completed
Maintenance frequency	As needed (re-run when the SVTM or BOS registers are updated)

Extent

Element	Value
Geographic extent	New South Wales, Australia
Bounding box (WGS84)	West 141.0°, East 153.7°, South −37.5°, North −28.1°
Temporal extent	Vegetation as mapped in SVTM C2.0M2.2 (clearing to 2021); BOS demand from Nov 2019 to Oct 2026; CAPAD 2024
Reference date	11 October 2026 (creation)

Spatial representation

Element	Value
Spatial representation type	Vector (polygons); tabular summaries
Coordinate reference system	GDA94 / NSW Lambert (EPSG:3308)
Scale or resolution	Derived from a 5 m raster vegetation map; suitable for regional analysis (1:25,000 at best)
Spatial unit	IBRA v7.1 subregion (132 subregions in NSW)

Data quality

Element	Value
Lineage	1. PCT IDs and % cleared from the BioNet Vegetation Classification (OData). 2. IBRA v7.1 subregions (DCCEEW) clipped to NSW; 5 border slivers removed. 3. Target PCT polygons (105,009) queried from the SVTM C2.0M2.2 ArcGIS service. 4. Vegetation intersected with subregions (106,176 pieces). 5. Protected area measured against CAPAD 2024 NSW (1,018 areas) using a spatial index, capped at piece area so overlapping reserves are not double counted. 6. Score = share of the PCT's unprotected remnant × credits retired per year (BOS registers) × (1 + BioNet % cleared). 7. Sensitivity tested under four weightings.
Positional accuracy	Inherited from the SVTM (line work accurate to about 5 m; regional scale). IBRA and CAPAD boundaries as supplied.
Thematic accuracy	SVTM PCT-level accuracy reported as 57–76% by region (2022 technical notes). No new figure is published for C2.0M2.2.
Completeness	PCT 1600 is excluded (retired in 2022, not in the SVTM). PCT 1604 maps to only 5 ha. Remnants under 10 ha per subregion are excluded from scoring.
Logical consistency	Mapped totals match the SVTM service statistics exactly for all six PCTs. Ranking re-runs reproduce identical results.
Known issues	Mapped pre-clearing (1750) extents disagree with BioNet % cleared, so BioNet figures are used for threat (see `extent_check.csv`).

Distribution and constraints

Element	Value
Format	CSV, GeoPackage, PNG maps
Online resource	github.com/Likithaa07 (repository: nsw-credit-opportunity-map)
Licence	Derived data released under CC BY 4.0. Source data © State of NSW (DCCEEW) and Commonwealth of Australia (DCCEEW), CC BY.
Use limitation	Areas for further investigation only. Not a substitute for a Biodiversity Assessment Method site survey.
Security constraints	No sensitive species locations are included; only counts by subregion (BioNet Sensitive Species Data Policy).

Metadata about the metadata

Element	Value
Metadata standard	ANZLIC Metadata Profile v1.1 (AS/NZS ISO 19115:2005)
Metadata date	11 October 2026
Point of contact	Likitha Vankadoth (github.com/Likithaa07)
Language and character set	English; UTF-8
