Decisions log

Each decision records what was decided, why, and its effect on the results.

#	Decision	Why	Effect
1	Dropped **PCT 1600** from the target list	Retired in the 2022 eastern NSW revision; no confirmed replacement; not in the SVTM	6 target PCTs instead of 7 (1600 was ranked last of the seven)
2	Used **BioNet % cleared**, not the mapped 1750 extent, for threat	The pre-clearing map shows almost no clearing for most targets (e.g. 94% of PCT 290 left vs 67% cleared in BioNet)	Threat weighting follows the official BAM figures (see `extent_check.csv`)
3	Reviewed the **Biodiversity Values Map** but did not score it	It marks land where the BOS applies to development, not land suited to supply	No effect on the ranking
4	Queried the **SVTM map service** instead of downloading the 12.5 GB package	The SEED download is behind bot protection; the service gives the same polygons for just the target PCTs	Totals match the service statistics exactly
5	Measured protection with a **spatial index**, not a dissolve	The dissolve approach ran for 30+ minutes; the indexed approach takes seconds	Overlapping reserves are capped at the piece area, so nothing is double counted
6	Excluded remnants **under 10 ha** per subregion from scoring	Removes slivers from boundary cutting	PCT 1604 (5 ha) is not scored
7	Kept BioNet species counts as **context only**	Record counts reflect survey effort (the coast is surveyed far more)	Not part of the score
8	Reported species as **counts by subregion only**	BioNet Sensitive Species Data Policy	No coordinates are published
